

Given Prior to Admission

A new option is now available on eMAR to indicate that a medication was given prior to admission (such as aspirin). This will allow nursing to accurately document why they are bypassing KBMA scanning.

Barcode Verification Override Reason

You are documenting a medication administration on a nursing unit that uses barcode verification. Please enter a reason.

Reason:

- Added a scheduled task
- Barcode unreadable/missing
- Frequency change/RX relabeled
- Given prior to admission**
- In procedural location
- Non-formulary
- Patients own medication
- Scancode not defined
- Urgent/emergent
